Karena saya bingung bikin soal yang tidak sulit dan tidak mudah bagaimana, buat saja kode dari pseudo-code di bawah

```
function Exp3(input a :real, n : integer) → real
{ mengembalikan nilai a^n, dihitung dengan metode Divide and Conquer }

Algoritma:
  if n = 0 then
    return 1
  else
    x ← Exp3(a, n div 2)
    if odd(n) then { fungsi n ganjil }
      return x * x * a
    else
      return x * x
    endif
  endif
endif
```

Tapi edit agar code mengoutput seperti Output Format dan contoh di Test Case

(SAYA BIKIN OUTPUT GINI AGAR KALIAN DIPAKSA MENGGUNAKAN DIVIDE AND CONQUER METHOD)

WARNING !!

- MAKSIMAL ANGKA DIBELAKANG KOMA 2 DAN DIBULATKAN KE ATAS
- ANGKA DIBELAKANG KOMA JIKA TIDAK PENUH 2 DIBERI 0 DIBELAKANGNYA
- CONTOH = 3.00, 4.00, 2.10 , 3.30, 4.23, 4532.31, dll
- HINT = C++ Pake library iomanip, function setprecision dan fixed
- HINT = C Bisa Pake %.2f
- HINT = Python Gatau :) (jujur wkwkwk)

Input Format

- Baris Pertama Merupakan nilai a
- Baris Kedua Merupakan nilai n

Constraints

- $a \in \mathbb{R} \mid 0 \leq a \leq 100$
- $n \in \mathbb{int} \mid 0 \leq n \leq 10$

Output Format

- Print Nilai x
- Print Nilai Rekursif Ganjil/Genap
- Baris Terakhir Hasil Pangkat

Sample Input 0

```

5
```

Sample Output 0

```
Nilai x -> 1.00
